

### SURVEILLANCE WEEK 48 (November 25– December 1) 2007

This issue of the Ontario Influenza Bulletin provides information on the surveillance period from November 25 - December 1, 2007, (Week 48). The analysis for this issue occurred on Thursday December 6, 2007, therefore all data is current to that date unless otherwise specified.

Overall, influenza activity in Ontario during week 48, 2007 was similar to week 47, 2007. Five sporadically occurring cases of influenza A were reported through iPHIS from health units. There were no new reports of institutional outbreaks of influenza. For week 48, the highest level of influenza activity was 'sporadic' reported from Central East, Central West and Toronto health regions while the remaining health regions reported 'no activity' for influenza.

In Canada for week 47, influenza activity levels remained low in Canada; most regions across the country reported 'no activity'. The number of regions reporting 'sporadic' influenza activity increased from 9 regions in week 46 to 22 regions in week 47<sup>†</sup>.

Over the next few months, readers may note some changes in the content of the Ontario Influenza Bulletin. At the Influenza and Respiratory Infection Outbreak Surveillance Workshop held on October 9, 2007 health unit participants made a number of suggestions to modify its content, and we are working towards the implementation of many of these suggestions.

Please note that the GIS map for influenza activity levels by health unit has been replaced by a table (Table 5, page 8). We apologize for the inconvenience.

Please continue to submit weekly activity reports weekly by 4 p.m. every Tuesday. Please refer to pages 12 & 13 for report submission dates.

**Table 1: Summary of confirmed influenza cases and institutional influenza outbreaks by health region (Week 48, 2007).**

Confirmed influenza cases*	HEALTH REGION							TOTAL
	North West	North East	Eastern	Central East	Toronto	South West	Central West

SOURCE: MOHLTC (iPHIS, Health Unit Reports have been extracted using CRN at PHD)

\* Cumulative case counts include late reports and records that are otherwise reconciled. Therefore, cumulative counts may not equal new cases plus previous cumulative value.

† Episode Date for a case corresponds to the earliest date on record for the case according to the iPHIS hierarchy (Symptom Date > Clinical Diagnosis Date > Specimen Collection Date > Lab Test Date > Reported Date)

‡Note that the case of influenza reported from Simcoe Muskoka District represents a case co-infected with Influenza A & B

### Influenza Subtype(s):

During week 48, 1789 isolates were received by the Public Health Agency of Canada, with eight testing positive for influenza A and two for influenza B. The majority of influenza A isolates (5) were from Ontario (62.5%), while one each (12.5%) were from Quebec, Alberta and British Columbia. Two influenza B isolates were reported, one from Ontario and one from Quebec\*

### Antigenic Characterization:

The National Microbiology Laboratory (NML) has characterized 9 influenza viruses for the 2007-2008 influenza season: 1 A(H1N1), 4 A(H3N2) and 4 B viruses. The influenza A/H1N1 virus was antigenically similar to A/Solomon Islands/3/2006 (which is the influenza A(H1N1) component recommended for the 2007-2008 influenza vaccine). Of the 4 influenza A(H3N2) viruses characterized, 3 were antigenically similar to A/Wisconsin/67/2005 (which is the influenza A(H3N2) component recommended for the 2007-2008 influenza vaccine) and 1 was antigenically similar to A/Brisbane/10/2007. One of the 3 A/Wisconsin-like viruses had reduced titer to A/Wisconsin/67/2005 reference antiserum. The 4 influenza B isolates characterized were antigenically similar to B/Florida/4/2006, belonging to the B/Yamagata lineage, and is the B component recommended for the 2007-2008 influenza vaccine in the Southern Hemisphere.\*\*

### Antiviral Resistance:

Since the start of the season, the NML has tested 7 influenza A isolates (1 H1N1 and 6 H3N2) for amantadine resistance (from Ontario, Alberta and British Columbia). Four (57% or 4/7) of the isolates tested were resistant to amantadine, all of which were H3N2 (3 of which originated from Ontario and one from Alberta). Of the 6 isolates tested for oseltamivir resistance (4 influenza A, 2 influenza B), none were found to be resistant..\*\*

**Note:** The WHO recommends that the trivalent vaccine for the 2007-2008 season in the northern hemisphere (which includes Canada) contain an A/Solomon Islands (H1N1)-like virus; an A/Wisconsin (H3N2)-like virus; and a B/Malaysia-like virus.

\* These data have been obtained from the Respiratory Virus Detection tables of Public Health Agency of Canada: Week 48, 2007.

\*\* These data have been obtained from the FluWatch report of the Public Health Agency of Canada for Week 47, 2007.

#### **APPENDIX - I**

##### **Definitions for influenza activity levels:**

**No Data:** No activity report corresponding to the surveillance week was received at the Ministry of Health and Long-Term Care Call Centre by the Tuesday (at 4 p.m.) following the end of the surveillance period.

**No Activity:** **No laboratory confirmed\* influenza and NO outbreaks detected** within the health unit/ influenza surveillance area, within the prior week, although sporadically occurring ILI may or may not be present.†

**Sporadic:** Sporadically (infrequently) occurring ILI and at least one lab-confirmed influenza\* case with NO outbreaks detected within the health unit area.†

**Localized:** sporadically occurring ILI and lab-confirmed influenza\* together with outbreaks of ILI in schools and work sites, or laboratory-confirmed influenza in residential institutions occurring in < 50% of the health unit. Outbreaks affect a single and/or adjacent geographic area within the health unit jurisdiction, e.g. outbreaks in a nursing home and a school in close proximity to each other.†

**Widespread:** sporadically occurring ILI and lab-confirmed influenza\* together with outbreaks of ILI in schools and work sites, or laboratory-confirmed influenza in residential institutions occurring in > 50% of the health unit. Outbreaks affect multiple and non-adjacent geographic areas within the health unit jurisdiction, such as two or more regions of the health unit, two or more municipalities, two or more electoral wards, etc.†

\* Confirmation of influenza within the surveillance region at any time within the prior week

† Sub-regions within the province or territory as defined by the provincial/territorial epidemiologist

##### **Influenza-Like Illness (ILI) Definitions:**

###### **A) ILI in the general population:**

Acute onset of respiratory illness with fever and cough and with one or more of the following - sore throat, arthralgia, myalgia, or prostration which could be due to influenza virus. In children under 5, gastrointestinal symptoms may also be present. In patients under 5 or 65 and older, fever may not be prominent.

###### **B) ILI/Influenza outbreaks:**

**Schools and work sites:** greater than 10% absenteeism on any day, most likely due to ILI.

**Residential institutions:** two or more cases of ILI within a seven-day period, including at least one laboratory confirmed case.
